3S03 Animal Behaviour Laboratory

This unique course offers students an opportunity to be outdoors during the warm and sunny summer months studying the behaviour of animals in their environment!

The course is split into two sections. In the first, students will be guided through a series of small practicals which will expose them to the nature of observation, experimentation, and interpretation. In the second half of the term, students will be left on their own to pursue a project of their choosing where they can apply what they have learned about behavioural research. Additional skills developed include scientific report writing, presenting with PowerPoint as well as graphing and statistically analyzing data with Excel.
